INTRODUCTION

The basic components of any sound-reproducing system, without dependence from its class is the power amplifier of audio frequencies called also the power audio amplifier.

With reference to consumer and professional electronics equipments, the greatest popularity are the integrated circuits- power audio amplifiers, due to their advantages - schematic simplicity, small dimensions, large range of output powers, functionality.

For correct usage of integrated circuits of the power audio amplifiers, irrespective of a field of application, it is necessary to know following:

- Function of integrated circuit;
- The main electrical characteristics;
- Schematic of connection and (or) internal structure;
- Package type;
- Equivalents (replacements).

In the literature, the great many of the characteristics which one describe the electrical and operational parameters of power audio amplifiers depending on evaluation yardsticks and can give completely different estimations to quality of operation of a amplifiers. Main of parameters used for the description of power audio amplifiers is following: a **gain**; a **bandwidth**; a **dynamic** (phase, phase-frequency, **peak** (amplitude)) **characteristic**; **linear** and **nonlinear distortions**; **efficiency**; **input characteristics** (impedance, current, voltage and power, impedance of a source of an input sound signal); **output characteristics** (impedance, current, voltage, output power); a **dynamic range**; **signal-to-noise ratio** and maximum ratings of electrical parameters.

The **gain Gv** (on a current, a voltage or power, depending on purpose of the amplifier) represents the logarithm of the ratio of signal output from an amplifier to signal input to the amplifier. The gain **Gv** can be expressed as a direct ratio (V/mV or $V/\mu V$), and in the logarithmic relation (in decibels -dB). The gain depends on value of external components, from resistance of loading R_L , input resistance R_{in} , a supply voltage V_{cc} , frequency and temperature.

The **frequency bandwidth Bw** - area of frequencies (a bandwidth from bottom limit frequency F_L up to top frequency F_H) within the gain changes no more than on ± 3 dB, concerning gain measured on frequency 1 KHz. In the certain cases when the manufacturer wants to emphasize the expanded range of working frequencies of the amplifier at the improved non-uniformity frequency characteristics, the size of non-uniformity (1 dB, 0,5 dB etc.) is indicated also.

Instead of a frequency bandwidthH, sometimes defined a frequency bandwidth at gain equal to unit or a power frequency bandwidth. The frequency bandwidth at gain equal to unit is an interval of frequencies on which borders the gain values equal to unit. The power frequency bandwidth is an interval of frequencies within the limits of which at the certain factor of distortions k , output power changes no more, than on ± 3 dB in relation to output power on frequency in 1 KHz.

The **dynamic range** determines a ratio between maximum output and input tension of the amplifier. The ratio usually expresses in decibels and represents (in a theoretical case) a linear function.

The **frequency characteristics** determine relation of a gain of amplifier to frequency; **phase characteristics** - the phase shift of an output signal on relation to input signal (in frequency function of an input signal).

The **frequency - phase characteristic** summarizes frequency and phase characteristics of the amplifier in the field of a range of reproduced frequencies.

All amplifiers alter input signals, generally in two ways: they make them stronger (amplify) them, and they add characteristics which did not exist in the original signal. These undesirable characteristics are lumped together and called distortion. Noise can be considered a type of distortion.

One common type of distortion is **harmonic distortion**. Harmonics of a signal are signals which are related to the original (or fundamental) by an integer (non decimal) number. A pure tone (sine wave) signal has no harmonics; it consists of only one single frequency. If pure tone signal was applied to the input of an amplifier, we would (upon measurement with special test equipment) find that the output signal of the amplifier was no longer pure. Careful measurements would likely show that several "new" frequencies have appeared. These new frequencies are almost certainly to be integer multiples of the original tone; they are the harmonics of the original signal. In a good amplifier, the harmonics will be much weaker than the original tone. By much weaker, we mean on the order of a thousand times for decent amplifiers.

Intermodulation distortion is the second "major" type of distortion that is often specified for amplifiers. Intermodulation distortion is much more objectionable to the human ear, because it generates non-harmonically related "extra" signals which were not present in the original. Basically, two pure tones are simultaneously applied to the input of the amplifier. If the amplifier were perfect, the two tones (and only the two tones) would be present at the amplifier output. In the real world, the amplifier would have some harmonic distortion (as described above), but careful observation of the output signal (using laboratory equipment) would reveal that there are a number of new tones present which cannot be accounted for as a result of harmonic distortion. These "new" tones are called "beat products" or "sum and difference" frequencies, and are a result of the interaction of the two pure tones within the amplifier. No amplifier is perfect, all have some non linear characteristics. Whenever two signals are applied to a nonlinear system, new signals (in addition to the original two) are generated. For a good amplifier, the new signals are very small in relation to the two original tones.

All amplifiers are generally rated for **Total Harmonic Distortion** (or THD), usually at full power output over a given frequency band with a particular load. Good values are anything less than 0.5 %THD. When an amplifier is measured for THD, a pure tone is applied to the input and the output is measured with special test equipment. The energy of the pure tone is measured, and the energy of the harmonics is measured. Those two values are compared, and a THD rating is calculated. A THD rating of 1% means that the total energy of all the harmonics combined is one one-hundredth of the energy in the fundamental. Harmonic distortion (although certainly undesirable) is one of the more tolerable types of distortion as long as it is kept reasonably low. Distortion levels of 10% may be very tolerable.

At increase of input signal U_{in} the output voltage, a current and power are increased, but also the factor of nonlinear distortions simultaneously grows. Therefore, for reduction of nonlinear distortions target capacity of the amplifier are artificial limit in comparison with the greatest possible output power.

As **sensitivity** of the amplifier understand value of the sine wave input voltage, necessary for obtain of the maximal output power. Frequently, some manufacturers indicate value of a nominal input voltage. A nominal input voltage is a sine wave voltage applied to an input of the amplifier for obtain of nominal output power. It is meant, that the volume regulator of the amplifier should be exposed on the maximal value.

Besides linear and nonlinear distortions, any real amplifier generates the additional signals. Because of it, on an output of the amplifier there is a signal distinct from zero, even in absence of an entrance signal. This signal called as output noise and can be considered as the sum of infinite number of sine wave voltage (not only harmonious) including in a sound range of frequencies. Sources of internal noise of the amplifier are thermal noise of resistors, and also shot, flickering and thermal noise of active components (transistors and diodes). Quantitatively a value of noise on an output describe through effective value of noise U_{no} . As the voltage of noise grows simultaneously with a range of reproduced frequencies, it is necessary to specify frequencies within the limits of which measurements of noise on an output of the amplifier were made. If the range of frequencies is not underlined, own noise are measured within the limits of a working range of frequencies of the amplifier.

The range of change of an output voltage is determined by a difference between the maximal and minimal instant value of a voltage on an output of the amplifier. This parameter called sometimes a **peak output voltage** and designates Up-p (peak-to-peak).

There are many terms used to describe the **amplifier power ratings**- the maximal sinusoidal power, maximal continuous power, RMS power, music power (IHF), peak power, instantaneous power. Depending on indicated term for output power, the same amplifier can have value which one differ in some times. Not resorting to the theories we shall mark that:

Maximal sinusoidal power- is the power delivered on optimal load (for the given amplifier), at a sine-wave input signal, when THD of the output signal reaches value of 10%.

Maximal continuous power- this same as maximal sinusoidal power and occurs under such name in the datasheets of USA and Japan manufacturers.

RMS power- (Root Mean Square power). In the simplified form is described as the power, giving on optimal load (for the given amplifier), at a sine-wave input signal, when output signal completely limits by an output stage of the amplifier and gains the square shape.

Musical power- IHFM (Institute of High Fidelity Manufacturers) is the power delivered on optimal load (for the given amplifier), at a complex (musical) input signal, when THD of the output signal reaches value of 10%.

The peak power and instantaneous power describe extreme (critical) operation conditions of the amplifier and are specified basically in the advertising purposes.

The **impedance of load R_L** has optimal value for each amplifier and determines an maximum output current (power) giving by the amplifier. If the impedance of load is less than a optimal value, an output current (accordingly output power) of the amplifier can exceed maximum rating and he can be shattered. If the impedance of load is more than optimal value, the output current (accordingly output power) of the amplifier will be less (under identical conditions of operation) than is specified for the given amplifier.

On a connection type of load it is possible to distinguish single ended (**SE**) and Bridged-Tied Loads (**BTL**) amplifiers. On a single ended amplifiers the load are connected between an amplifier output and ground (GND). Bridged amplifiers work basically as follows: a single input signal is applied to the amplifier. Internal to the amp, the input signal is split into two signals. One is identical to the original, and the second is inverted (sometimes called phase-flipped). The original signal is sent to one channel of the amp, and the inverted signal is applied to the second channel. Amplification of these two signals occurs just like for any other signal. The output results in two channels which are identical except one channel is the inverse of the other. The load is connected between the two amplifier output terminals. In words, one channel "pulls" one way while the second channel "pulls" in the opposite direction. This allows to deliver (at same load and at same power supply) in 3 times lot of power than at single ended amplifiers.

Due to improvements in the speed and efficiency of modern semiconductor devices, the **Class-D** amplifiers recently have received broad applying. Class-D amplifiers use a technique called pulse width modulation (sometimes combined with pulse frequency modulation). The input signal is converted to a sequence of pulses whose width at any time is proportional to the amplitude of the signal at that time. The frequency of the pulses is typically thirty or more times the highest frequency of interest in the input signal. The main advantages of class-D amplifiers are efficiency and simplicity. Efficiencies are in the 80% to 90% range. Because the output pulses have fixed amplitude, the switching elements (usually MOSFETs) are switched either on or off, rather than operated in linear mode. This means that very little power is dissipated by the transistors except during the very short interval between the on and off states. The wasted power is low because the instantaneous power dissipated in the transistor is the product of voltage and current, and one or the other is almost always close to zero.

2016 edition databook proposes the short but full presentation of the **7100** integrated circuits - power audio amplifiers that exist on the market; presentation consisting with schematic diagrams (schematic of connections and (or) internal structure), short specification and basically electrical characteristics.

The schematic diagrams of pin-to-pin compatible integrated circuits are arranged in the same place. They are not specifically equivalent (replacements) with each other (can have different electrical characteristics and (or) type of case); for detection of equivalent it is necessary to consult an electrical characteristics.

Full technical aspect about power audio amplifiers- integrated circuits presented in the book is incomplete, therefore for in-depth familiarity with the characteristics of integrated circuits you can download datasheets of ICs from:

Electronic format databooks section

NEW! • Integrated circuit audio power amplifiers

A new, 2016 edition data book presents the standard and modified circuit diagram, short description, electrical characteristics and pin-outs of the integrated circuits - power audio amplifiers. This book includes 7100 most popular integrated circuits - power (final) audio amplifiers and for today is the most complete databook in the world.

Online SMD-codes database

A monthly updated online database that includes now more than 285.000 marking codes for different SMD and leaded, passive and active electronic components like fuses, diodes, thyristors, transistors and integrated circuits.

- Search by marking code;
- Search by marking code with case type (pin number) selection;
- Direct link to a electronic component datasheet download;
- Direct link to a manufacturer web page.

[Log-in to a online SMD-codes database](#)

Service manuals

Service manuals for copiers, fax, printer, mobile and wireless phone, amplifiers, car stereos, cassette decks, Blu-ray players/recorders, compact stereos, equalizers, receivers, cameras, reel recorders, tuners, and other audio equipment, camcorders, monitors, TVs (including LCD, plasma PDP, projection TVs), and TV/Blu-ray/DVD/CD/VCR combo units. We have more than 80.000 documents in our growing collection!

[Service manuals contents](#)

Audio application integrated circuit datasheets

More than 5000 datasheets- audio application integrated circuits such as preamplifiers, volume and tone controller, audio processor, audio power amplifier available on your collection.

Schematic diagram

Short description

Characteristics

Dual BTL power audio amplifier with DC volume control and stand-by

1233-F12	AN17822A
AN7522	CD7522CS
AN7522N	CD17821CS
AN17820A	NTE7221
AN17820B	PA7522-H12
AN17821A	PA7522L-H12

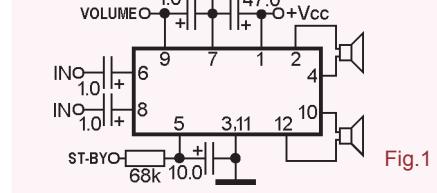

Fig.1

Application: TV, audio equipments, personal computers, active speakers

Features:

- Pin-to-pin and case compatible types with variable electrical characteristics
- Built-in stand-by function (stand-by: LOW) and DC volume control circuit ($UVol = 0...1.25V$)
- Built-in thermal shutdown circuit (operates at about $T_j=150^{\circ}C$). Reset automatically if the temperature drops.

Fig.1 shows a typical application

Dual BTL power audio amplifier with DC volume control and stand-by

1233-H14-B
PA7522-H14-B
PA7522L-H14-B

Application: TV, audio equipments, personal computers, active speakers

Features:

- Pin-to-pin, case and electrical characteristics compatible types
- Built-in stand-by function (stand-by: LOW) and DC volume control circuit ($UVol = 0...1.25V$)
- Built-in thermal shutdown circuit (operates at about $T_j=150^{\circ}C$). Reset automatically if the temperature drops.

Fig.2 shows a typical application.

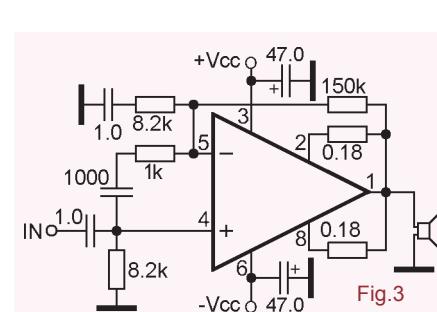

Fig.3

Application: HiFi home audio systems

Features:

- Pin-to-pin and case compatible types with variable electrical characteristics

Dual power audio amplifier with stand-by

STK403-070

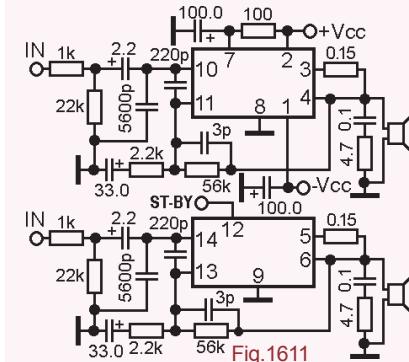

Fig.1611

Application: Hi-Fi component systems

Features:

- Class AB power audio amplifier
- Dual (bipolar, symmetrical) power supply
- Stand-by function (Ust < 0.6V: stand-by; Ust > 0.6V: operates)
- Designed to support 6Ω loads
- Typ. 0.03% THD

Fig.1611 shows a typical application.

Type	Case	Uccmin	Uccmax	Icc0	Poutmax	Rinom	Bw	Rin	THD	Gv	Mnf
STK403-070	H7-14	±30V	±50V	40mA	2x40W	6Ω	20Hz-50kHz	55kΩ	0.03%	30dB	San

3-channel power audio amplifier with stand-by

STK403-240A
STK403-250A

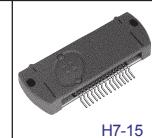

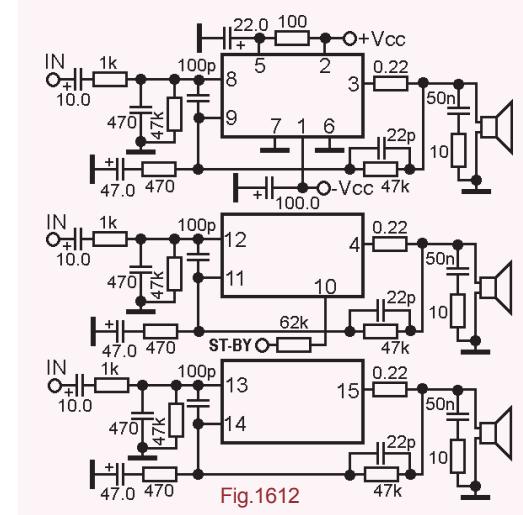

Fig.1612

Application: home theater multispeaker audio systems, Hi-Fi component systems

Features:

- Pin-to-pin and case compatible types with variable electrical characteristics
- Class AB power audio amplifier
- Dual (bipolar, symmetrical) power supply
- Stand-by function (Ust < 0.6V: stand-by; Ust > 0.6V: operates)
- Designed to support 6Ω loads

Fig.1612 shows a typical application.

Type	Case	Uccmn	Uccmx	Icc0	Poutmx	Rinom	Bw	Rin	THD	Gv	Mnf
STK403-240A	H7-15	±18V	±38V	45mA	3x40W	6Ω	20Hz-50kHz	55kΩ	0.02%	30dB	San

- Output mute function (MUTE, active LOW)
- Built-in sleep function (SLEEP, active LOW)
- Protection (PROT pin) warning signal output terminal for overcurrent, overtemperature, output DC voltage, low Vcc voltage and clock detection. PROT terminal outputs "LOW" level when either of those detection circuitries detects an abnormality state

Fig.21124 shows a typical application

Type	Case	V _{ccmn}	V _{ccmx}	I _{cc0}	P _{outmx}	R _L	B _w	R _{in}	THD	G _{vc}	M _{nf}

BTL class-D power audio amplifier with shutdown

ZA2030EWR

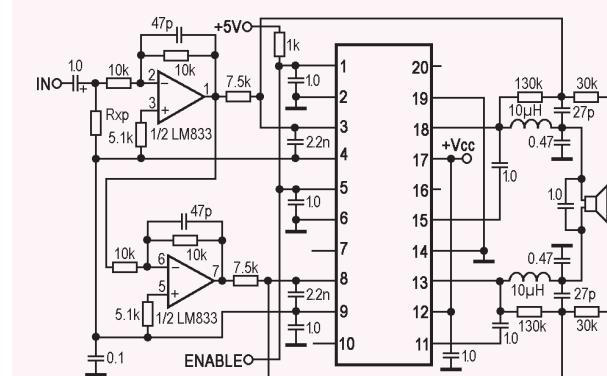

Fig.2125

Application: TV sets and portable radio

Features:

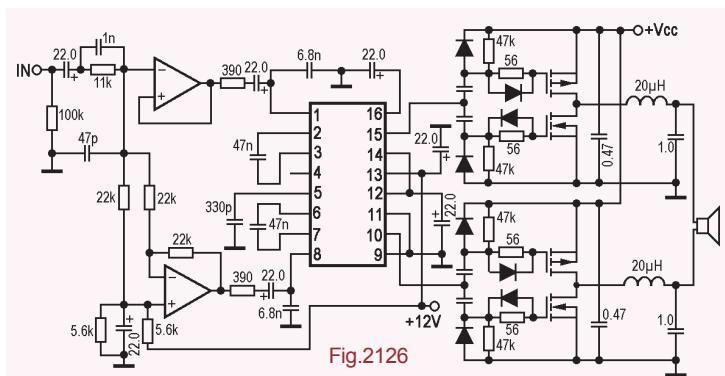

- Shutdown (ENABLE pin) built-in (active: LOW)

Fig.2125 shows a typical application

Type	Case	V _{ccmn}	V _{ccmx}	I _{cc0}	I _{outmx}	P _{outmx}	R _L	B _w	R _{in}	THD	G _{vc}	M _{nf}

I²C-bus specification

The I²C-bus specification

1 PREFACE

1.1 Version 1.0 - 1992

This version of the 1992 I²C-bus specification includes the following modifications:

- Programming of a slave address by software has been omitted. The realization of this feature is rather complicated and has not been used.
- The “low-speed mode” has been omitted. This mode is, in fact, a subset of the total I²C-bus specification and need not be specified explicitly.
- The Fast-mode is added. This allows a fourfold increase of the bit rate up to 400 kbit/s. Fast-mode devices are downwards compatible i.e. they can be used in a 0 to 100 kbit/s I²C-bus system.
- 10-bit addressing is added. This allows 1024 additional slave addresses.
- Slope control and input filtering for Fast-mode devices is specified to improve the EMC behaviour.

NOTE: Neither the 100 kbit/s I²C-bus system nor the 100 kbit/s devices have been changed.

1.2 Version 2.0 - 1998

The I²C-bus has become a de facto world standard that is now implemented in over 1000 different ICs and licensed to more than 50 companies. Many of today’s applications, however, require higher bus speeds and lower supply

voltages. This updated version of the I²C-bus specification meets those requirements and includes the following modifications:

- The High-speed mode (Hs-mode) is added. This allows an increase in the bit rate up to 3.4 Mbit/s. Hs-mode devices can be mixed with Fast- and Standard-mode devices on the one I²C-bus system with bit rates from 0 to 3.4 Mbit/s.
- The low output level and hysteresis of devices with a supply voltage of 2 V and below has been adapted to meet the required noise margins and to remain compatible with higher supply voltage devices.
- The 0.6 V at 6 mA requirement for the output stages of Fast-mode devices has been omitted.
- The fixed input levels for new devices are replaced by bus voltage-related levels.
- Application information for bi-directional level shifter is added.

1.3 Version 2.1 - 2000

Version 2.1 of the I²C-bus specification includes the following minor modifications:

- After a repeated START condition in Hs-mode, it is possible to stretch the clock signal SCLH (see Section 13.2 and Figs 22, 25 and 32).
- Some timing parameters in Hs-mode have been relaxed (see Tables 6 and 7).

I²S-bus specification

I²S bus specification

1.0 INTRODUCTION

Many digital audio systems are being introduced into the consumer audio market, including compact disc, digital audio tape, digital sound processors, and digital TV-sound. The digital audio signals in these systems are being processed by a number of (V)LSI ICs, such as:

- A/D and D/A converters;
- digital signal processors;
- error correction for compact disc and digital recording;
- digital filters;
- digital input/output interfaces.

Standardized communication structures are vital for both the equipment and the IC manufacturer, because they increase system flexibility. To this end, we have developed the inter-IC sound (I²S) bus – a serial link especially for digital audio.

2.0 BASIC SERIAL BUS REQUIREMENTS

The bus has only to handle audio data, while the other signals, such as sub-coding and control, are transferred separately. To minimize the number of pins required and to keep wiring simple, a 3-line serial bus is used consisting of a line for two time-multiplexed data channels, a word select line and a clock line.

Since the transmitter and receiver have the same clock signal for data transmission, the transmitter as the master, has to generate the bit clock, word-select signal and data. In complex systems however, there may be several transmitters and receivers, which makes it difficult to define the master. In such systems, there is usually a system master controlling digital audio data-flow between the various ICs. Transmitters then, have to generate data under the control of an external clock, and so act as a slave. Figure 1 illustrates some simple system configurations and the basic interface timing. Note that the system master can be combined with a transmitter or receiver, and it may be enabled or disabled under software control or by pin programming.

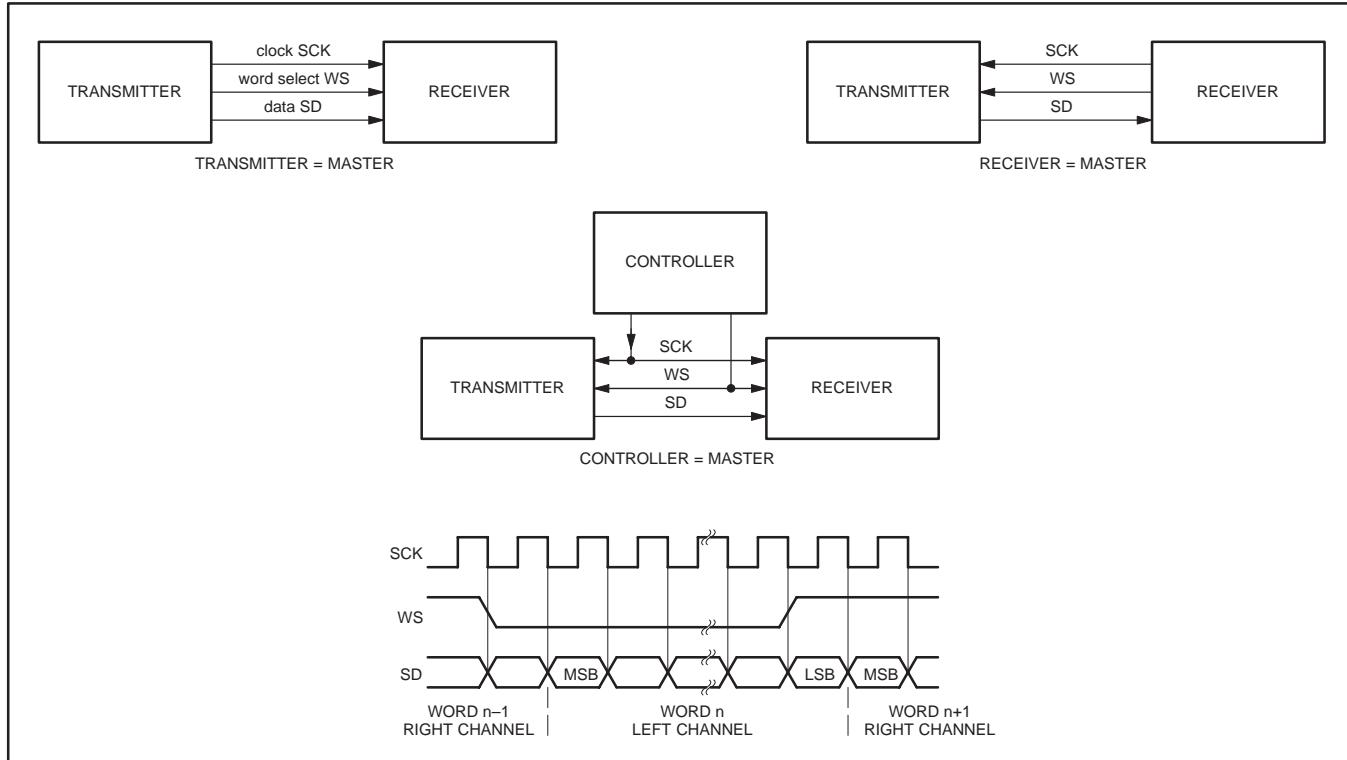

Figure 1. Simple System Configurations and Basic Interface Timing

SPI interface specification

SPI interface specification

OBJECTIVE

This document specifies the Serial Peripheral Interface (SPI) that is used in the 1-axis SCA61T and the 2-axis SCA100T inclinometers.

THE SPI INTERFACE

A Serial Peripheral Interface (SPI) system consists of one master device and one or more slave devices. The master is defined as a microcomputer providing the SPI clock, and the slave as any integrated circuit receiving the SPI clock from the master. The ASIC in VTI Technologies' products always operates as a slave device in master-slave operation mode.

The SPI has a 4-wire synchronous serial interface. Data communication is enabled with a low active Slave Select or Chip Select wire (CSB). Data is transmitted with a 3-wire interface consisting of wires for serial data input (MOSI), serial data output (MISO) and serial clock (SCK)..

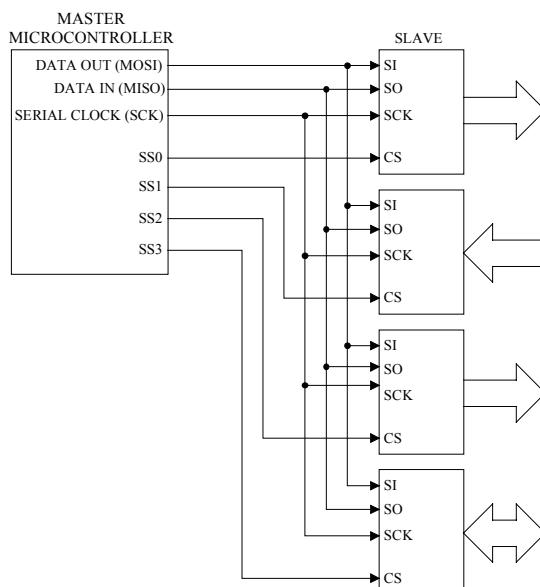

Figure 1. Typical SPI connection

The SPI interface in VTI products is designed to support almost any micro controller that uses software implemented SPI. However it is not designed to support any particular hardware implemented SPI found in many commercial micro controllers. The SPI interface is used for testing and calibration purposes, and it can also be used in the final application. Some of the test and calibration commands are disabled in normal use, and are not documented here. The data transfer uses the following 4-wire interface:

MOSI	master out slave in	$\mu P \rightarrow$ ASIC
MISO	master in slave out	ASIC $\rightarrow \mu P$
SCK	serial clock	$\mu P \rightarrow$ ASIC
CSB	chip select (low active)	$\mu P \rightarrow$ ASIC
